DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(a) the invention was known or used by others in this country, or patented or described in a printed publication in this or a foreign country, before the invention thereof by the applicant for a patent.

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

2. Claims 1-20 are rejected under 35 U.S.C. 102(a) or (e) as being clearly anticipated by Lin 6,477,447. Note especially figure 6 and its description.

Regarding claims 1-9, 19 and 20, '447 discloses the claimed invention used to determine the pressure uniformity of a wafer against a polishing pad, or other pressure components ("In addition, the pressure components applied in the embodiment of the present invention refer to, but not limited to, mechanical CMP pressure related components including a wafer carrier, a polishing pad, and mechanical arm members of a CMP machine.", column 3, lines 37-42). It is inherent that a conditioner for a polishing pad exerts pressure on the pad, and therefore qualifies as a pressure related component. As evidence of inherency, the examiner cites Berman, 6,722,948, which discloses that a conditioning tool to condition a wafer polishing pad is a pressure related component, and that it is known to measure the uniformity of pressure across the conditioning component.

Conclusion

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Pressure sensing methods and devices using pressure sensitive paper are cited of interest.
